Definition

A **vector** in \mathbb{R}^n consists of a list of n real numbers.

Example

The list $(5, \frac{2}{3}, e, -3)$ is a vector in \mathbb{R}^4 .

We can add vectors and multiply them by scalars.

Examples

$$(4, -7, 2) + (-1, 7, 3) = (3, 0, 5)$$

$$-3(4,-7,2) = (-12,21,-6)$$

Things you should already know

Matrices

Matrix algebra

definition

Definition

A **path** in \mathbb{R}^n is a vector whose entries are functions of a single variable. It can also be seen as a function of a single variable whose output is a vector in \mathbb{R}^n . For this reason, it can also be called a **vector-valued function** (or simply a **vector function**).

Example

 $\mathbf{x}(t) = \left(\sin 4t, \frac{e^t}{t}\right)$ is a vector function, $\mathbf{x}: \mathbb{R} \to \mathbb{R}^2$. And we can take its derivative:

$$\frac{d\mathbf{x}}{dt} = \left(4\cos 4t, \frac{t-1}{t^2}e^t\right).$$

Definition

An $m \times n$ matrix is a rectangular array of numbers arranged in m horizontal rows and n vertical columns. These numbers are called the **entries** or **elements** of the matrix.

Example

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$$

is an $m \times n$ matrix. It can be written more succinctly as $A = [a_{ij}].$

Two matrices are equal if they have the same size (identical numbers of rows and columns) and the same entries.

Definition

A $1 \times n$ matrix is called a **row** n-**vector**, or simply a **row vector**. An $n \times 1$ matrix is called a **column** n-**vector**, or a **column vector**. The elements of a such a vector are its **components**.

Examples

1. The matrix $\mathbf{a} = \begin{bmatrix} \frac{2}{3} & -\frac{1}{5} & \frac{4}{7} \end{bmatrix}$ is a row 3-vector.

2.
$$\mathbf{b} = \begin{bmatrix} 1 \\ -1 \\ 3 \\ 4 \end{bmatrix}$$
 is a column 4-vector.

Matrices

Matrix functions

Matrix algebra Matrix function algebra

Some definition Any matrix can be written as a list of row or column vectors.

Example

The matrix

$$A = \begin{bmatrix} -2 & 1 & 3 & 4 \\ 1 & 2 & 1 & 1 \\ 3 & -1 & 2 & 5 \end{bmatrix}$$

has three row 4-vectors:

$$\begin{aligned} \mathbf{a}_1 &= \begin{bmatrix} -2 & 1 & 3 & 4 \end{bmatrix}, \\ \mathbf{a}_2 &= \begin{bmatrix} 1 & 2 & 1 & 1 \end{bmatrix}, \text{ and } \\ \mathbf{a}_3 &= \begin{bmatrix} 3 & -1 & 2 & 5 \end{bmatrix} \end{aligned}$$

and we can write

$$A = \begin{bmatrix} \mathbf{a}_1 \\ \mathbf{a}_2 \\ \mathbf{a}_3 \end{bmatrix}.$$

Matrix function
algebra

definition

Definition

A matrix function is like a matrix, but replaces numbers with functions of a single real variable. Column vector functions and row vector functions are analogously defined.

Example

A(t) is a 2×3 matrix function:

$$A(t) = \begin{bmatrix} t^3 & t - \cos t & \frac{5}{t} \\ e^{t^2} & \ln(t+1) & te^t \end{bmatrix}.$$

The matrix function is only defined for values of t such that all elements are defined. In this example, A(t) is defined for values of t such that $t \neq 0$ and t+1>0.

Matrix functions

Matrix algebra

algebra

Some definition

Definition

If $A=\left[a_{ij}\right]$ and $B=\left[b_{ij}\right]$ are matrices with the same dimensions, their sum is

$$A + B = [a_{ij} + b_{ij}].$$

Similarly, their difference is

$$A - B = [a_{ij} - b_{ij}].$$

Example

We have

$$\begin{bmatrix} 2 & -1 & 3 \\ 4 & -5 & 0 \end{bmatrix} + \begin{bmatrix} -1 & 0 & 5 \\ -5 & 2 & 7 \end{bmatrix} = \begin{bmatrix} 1 & -1 & 8 \\ -1 & -3 & 7 \end{bmatrix}$$

and

$$\begin{bmatrix} 2 & -1 & 3 \\ 4 & -5 & 0 \end{bmatrix} - \begin{bmatrix} -1 & 0 & 5 \\ -5 & 2 & 7 \end{bmatrix} = \begin{bmatrix} 3 & -1 & -2 \\ 9 & -7 & -7 \end{bmatrix}.$$

Matrices

Matrix function

Matrix algebra Matrix function

Matrix functi Ilgebra

Some

A **scalar** is a real or complex number, as opposed to a vector or matrix.

Definition

If A is a matrix and s a scalar, then the product of s with A is the matrix obtained by multiplying every element of A by s. Symbolically, if $A = [a_{ij}]$ then $sA = [sa_{ij}]$.

Examples

If
$$A = \begin{bmatrix} 2 & -1 \\ 4 & 6 \end{bmatrix}$$
 then $5A = \begin{bmatrix} 10 & -5 \\ 20 & 30 \end{bmatrix}$.

If A and B are matrices with the same dimensions then

$$A - B = A + (-1)B.$$

Things you should alread know

Matrices

Matrix functio

Matrix algebra Matrix function

algebra

Some definitions

Matrix addition, subtraction, and scalar multiplication have familiar properties:

$$A + B = B + A$$

$$A + (B + C) = (A + B) + C$$

$$ightharpoonup 1A = A$$

$$ightharpoonup s(A+B) = sA + sB$$

$$(s+t)A = sA + tA$$

$$b s(tA) = (st)A = (ts)A = t(sA)$$

$$\mathbf{0} = \begin{bmatrix} 0 & \dots & 0 \\ \vdots & \ddots & \vdots \\ 0 & \dots & 0 \end{bmatrix}$$

$$A + 0 = A$$

$$A - A = 0$$

$$ightharpoonup 0A = \mathbf{0}$$

...but matrix multiplication does not!

Things you should already know

Matrices

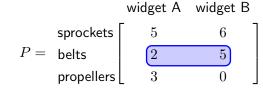

Matrix functions

Matrix algebra

Matrix function

Some definition

Example

customer 1 customer 2
$$O = \begin{array}{c} \text{widget A} \begin{bmatrix} 2 & 0 \\ 1 & 3 \end{bmatrix}$$
customer 1 customer 2

$$PO = \begin{array}{c} \text{sprockets} \begin{bmatrix} & 16 & 18 \\ & 9 & 15 \\ & & 6 & 0 \end{array}$$

Things you should alread know

Matrices

Matrix functions

Matrix algebra Matrix function algebra

Some

Some definition

Definition

Let $A = [a_{ij}]$ be an $m \times n$ matrix and $B = [b_{jk}]$ be an $n \times p$ matrix. Their product is the $m \times p$ matrix

$$AB = [c_{ik}]$$
 where $c_{ik} = \sum_{j=1}^{n} a_{ij}b_{jk}$.

If write write A as a matrix of rows and B as a matrix of columns,

$$A = \begin{bmatrix} \mathbf{a}_1 \\ \vdots \\ \mathbf{a}_m \end{bmatrix}$$
 and $B = \begin{bmatrix} \mathbf{b}_1 & \cdots & \mathbf{b}_p \end{bmatrix}$,

then we can express their product using the vector dot product

$$AB = [\mathbf{a}_i \cdot \mathbf{b}_k].$$

Things you should alread know

Matrices

Matrix functions

Matrix algebra

Matrix function algebra

Some definitions Earlier, we saw the matrix-column vector product

$$\begin{bmatrix} | & | & & | \\ \mathbf{a}_1 & \mathbf{a}_2 & \cdots & \mathbf{a}_m \\ | & | & & | \end{bmatrix} \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{bmatrix} = b_1 \mathbf{a}_1 + b_2 \mathbf{a}_2 + \cdots + b_m \mathbf{a}_m = A \mathbf{b}.$$

Matrix multiplication involves multiple columns on the right.

$$A \begin{bmatrix} | & | & | \\ \mathbf{b}_1 & \mathbf{b}_2 & \cdots & \mathbf{b}_p \\ | & | & | \end{bmatrix} = \begin{bmatrix} | & | & | \\ A\mathbf{b}_1 & A\mathbf{b}_2 & \cdots & A\mathbf{b}_p \\ | & | & | \end{bmatrix} = AB$$

Things you should alread know

Matrices Matrix functions

Watrix Idriction

Matrix algebra Matrix function

Some

Alternatively, we can work with rows. The matrix-row vector product is

$$\begin{bmatrix} b_1 & b_2 & \cdots & b_m \end{bmatrix} \begin{bmatrix} \begin{array}{ccc} & \mathbf{a}_1 & & \\ \hline & \mathbf{a}_2 & & \\ & \vdots & \\ \hline & & \mathbf{a}_m & \end{array} \end{bmatrix} = \sum b_i \mathbf{a}_i = \mathbf{b} A.$$

Then we can mutiply matrices by having multiple rows on the left.

$$\begin{bmatrix} ---- & \mathbf{b}_1 & ---- \\ ---- & \mathbf{b}_2 & ---- \\ \vdots & \vdots & ---- \\ ---- & \mathbf{b}_m A & ---- \end{bmatrix} = AB$$

Familiar properties of matrix multiplication

Things you should alread know

Matrices
Matrix functions

Matrix algebra

Matrix function

Some definitions

In most ways matrix multiplication behaves like multiplication of scalars:

- ightharpoonup A(BC) = (AB)C
- ightharpoonup A(B+C) = AB + AC
- (A+B)C = AC + BC
- (sA)B = s(AB) = A(sB)

Definition

The **identity matrix**, I_n (or just I), is the $n \times n$ diagonal matrix with ones on the main diagonal.

$$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \ I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \ ext{etc.}$$

If A is an $m \times n$ matrix then

$$AI_n = A$$
 and $I_m A = A$.

Things you should alrea know

Matrices

Matrix functions

Matrix algebra

Matrix function

Some definitions If A and B are $n \times n$ matrices, it is not always true that AB = BA.

Example

If
$$A=\begin{bmatrix}1&2\\-1&3\end{bmatrix}$$
 and $B=\begin{bmatrix}3&1\\2&-1\end{bmatrix}$ then

$$AB = \begin{bmatrix} 1 & 2 \\ -1 & 3 \end{bmatrix} \begin{bmatrix} 3 & 1 \\ 2 & -1 \end{bmatrix} = \begin{bmatrix} 7 & -1 \\ 3 & -4 \end{bmatrix}$$

but

$$BA = \begin{bmatrix} 3 & 1 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} 1 & 2 \\ -1 & 3 \end{bmatrix} = \begin{bmatrix} 2 & 9 \\ 3 & 1 \end{bmatrix}.$$

Things you should alrea know

Matrices

Matrix functions

Matrix algeb

Matrix function algebra

Some definitions All of the operations we discussed can be applied to matrix functions.

In the case of scalar multiplication, a matrix function can be multiplied by any *scalar function*.

Example

If $s(t) = e^t$ and $A(t) = \begin{bmatrix} -2 + t & e^{2t} \\ 4 & \cos t \end{bmatrix}$, their product is

$$s(t)A(t) = \begin{bmatrix} e^t(-2+t) & e^{3t} \\ 4e^t & e^t \cos t \end{bmatrix}.$$

Things you should already know

Matrices

Matrix function

Matrix algebra Matrix function algebra

Some definition

Additionally, we can do calculus with matrix functions!

Definition

Suppose $A(t) = [a_{ij}(t)]$ is a matrix function. Its **derivative** is

$$\frac{dA}{dt} = \left[\frac{da_{ij}(t)}{dt}\right]$$

and its integral over the interval [a,b] is

$$\int_{a}^{b} A(t) dt = \left[\int_{a}^{b} a_{ij}(t) dt \right].$$

Theorem (Matrix product rule)

If A and B are differentiable matrix functions and the product AB is defined then

$$\frac{d}{dt}(AB) = A\frac{dB}{dt} + \frac{dA}{dt}B.$$

Things you should already know

Matrices

Matrix functions

Matrix function

Some definitions Example

Let
$$A(t) = \begin{bmatrix} 2t & 1 \\ 6t^2 & 4e^{2t} \end{bmatrix}$$
. We have

$$\frac{dA}{dt} = \begin{bmatrix} 2 & 0\\ 12t & 8e^{2t} \end{bmatrix}$$

and

$$\int_0^1 A(t) dt = \begin{bmatrix} 1 & 1 \\ 2 & 2e^2 - 2 \end{bmatrix}.$$

Matrix functions

Matrix function algebra

Some

definitions

Definition

If A is the matrix $A = [a_{ij}]$, the **transpose** of A is the matrix $A^{T} = [a_{ii}].$

If A is an $m \times n$ matrix then A^T is an $n \times m$ matrix.

Example

Suppose A is the matrix

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}.$$

Then

$$A^T = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}.$$

Things you should alread know

Matrices

Matrix algebra Matrix function

Some definitions Square An $n \times n$ matrix is called a **square matrix** since it has the same number of rows and columns. The elements a_{ii} make up the **main diagonal**.

Triangular A square matrix is called upper triangular if

$$a_{ij} = 0$$
 whenever $i > j$,

that is, it has only zeros below the main diagonal. A **lower triangular** matrix is a square matrix with only zeros *above* the main diagonal, that is,

$$a_{ij} = 0$$
 whenever $i < j$.

Diagonal A diagonal matrix is a square matrix whose only nonzero entries lie along the main diagonal, that is,

$$a_{ij} = 0$$
 whenever $i \neq j$.

Things you should already know

Matrices

Matrix algeb

Matrix function algebra

Some definitions

Symmetric A matrix satisfying $A^T=A$ is called a symmetric matrix.

Skew-symmetric A matrix that satisfies $A^T = -A$ is called **skew-symmetric**.

Notice that

- both symmetric and skew-symmetric matrices must be square (because if A is $m \times n$ then A^T is $n \times m$),
- ightharpoonup a skew-symmetric matrix must have zeros along its main diagonal (because $a_{ii}=-a_{ii}$).
