

# Math 240: Diagonalization

Ryan Blair

University of Pennsylvania

Tuesday February 3, 2011

# Outline

- 1 Review of Last Time
- 2 Diagonalizability

# Review of last time

- 1 Interpret matrices as linear maps from  $\mathbb{R}^n$  to  $\mathbb{R}^m$ .
- 2 Found eigenvalues.
- 3 Found eigenvectors.

# How to find Eigenvalues

To find eigenvalues we want to solve  $Ax = \lambda x$  for  $\lambda$ .

$$Ax = \lambda x$$

$$Ax - \lambda x = 0$$

$$(A - \lambda I_n)x = 0$$

# How to find Eigenvalues

To find eigenvalues we want to solve  $Ax = \lambda x$  for  $\lambda$ .

$$Ax = \lambda x$$

$$Ax - \lambda x = 0$$

$$(A - \lambda I_n)x = 0$$

For the above to have more than just a trivial solution,  $(A - \lambda I_n)$  must be singular.

# How to find Eigenvalues

To find eigenvalues we want to solve  $Ax = \lambda x$  for  $\lambda$ .

$$Ax = \lambda x$$

$$Ax - \lambda x = 0$$

$$(A - \lambda I_n)x = 0$$

For the above to have more than just a trivial solution,  $(A - \lambda I_n)$  must be singular.

Hence, we solve the polynomial equation

$\det(A - \lambda I_n) = 0$  called the **characteristic equation**.

# Finding Eigenvectors

For each eigenvalue  $\lambda$ , solve the linear system  $(A - \lambda I_n)x = 0$  to find the eigenvectors.

# Today's Goals

- 1 Be able to diagonalize matrices.
- 2 Be able to use diagonalization to compute high powers of matrices.

# Diagonalizability

## Definition

An  $n \times n$  matrix  $A$  is **diagonalizable** if there exists an  $n \times n$  invertible matrix  $P$  and an  $n \times n$  diagonal matrix  $D$  such that  $P^{-1}AP = D$ .

When  $A$  is diagonalizable, the columns of  $P$  are the eigenvectors of  $A$  and the diagonal entries of  $D$  are the corresponding eigenvalues.

# Diagonalizability

## Definition

An  $n \times n$  matrix  $A$  is **diagonalizable** if there exists an  $n \times n$  invertible matrix  $P$  and an  $n \times n$  diagonal matrix  $D$  such that  $P^{-1}AP = D$ .

When  $A$  is diagonalizable, the columns of  $P$  are the eigenvectors of  $A$  and the diagonal entries of  $D$  are the corresponding eigenvalues.

**Example:** Verify that the following matrix is diagonalizable.

$$\begin{pmatrix} 2 & 3 \\ 1 & 4 \end{pmatrix}$$

# Diagonalizability Theorems

## Theorem

*A  $n \times n$  matrix is diagonalizable if and only if it has  $n$  linearly independent eigenvectors.*

## Theorem

*If an  $n \times n$  matrix has  $n$  distinct eigenvalues, then it is diagonalizable.*

# Diagonalizability Theorems

## Theorem

*A  $n \times n$  matrix is diagonalizable if and only if it has  $n$  linearly independent eigenvectors.*

## Theorem

*If an  $n \times n$  matrix has  $n$  distinct eigenvalues, then it is diagonalizable.*

**Note:** Not all diagonalizable matrices have  $n$  distinct eigenvalues.
