# Outline

- 1 Today's Goals
- 2 Review
- 3 Surface Integrals

# Today's Goals

- 1 Review of surface area for a parameterized surfaces.
- 2 Be able to evaluate Surface Integrals.

# Surface Area of a Parameterized Surface

Given a parametrization  $\mathbf{X} : D \rightarrow \mathbb{R}^3$  such that  $\mathbf{X}(s, t) = (x(s, t), y(s, t), z(s, t))$ .

The surface area of  $S = \mathbf{X}(D)$  is equal to

$$\int \int_D \| T_s \times T_t \| \, ds dt$$

# Scalar Surface Integrals

## Definition

Let  $\mathbf{X} : D \rightarrow \mathbb{R}^3$  be a smooth parametrized surface, where  $D$  is a region in  $\mathbb{R}^2$ . Let  $f : \mathbf{X}(D) \rightarrow \mathbb{R}$  be a continuous function. Then the **scalar surface integral** of  $f$  along  $\mathbf{X}$  is

$$\int \int_{\mathbf{X}} f dS = \int \int_D f(\mathbf{X}(s, t)) \| T_s \times T_t \| ds dt$$

**Example** Find  $\int \int_S x^2 + y^2 dS$ , where  $S$  is the outward oriented lateral surface of the cylinder of radius  $a$  and height  $h$  whose axis is the  $z$ -axis.

# Vector Surface Integrals

## Definition

Let  $\mathbf{X} : D \rightarrow \mathbb{R}^3$  be a smooth parametrized surface, where  $D$  is a region in  $\mathbb{R}^2$ . Let  $\mathbf{F}(x, y, z)$  be a continuous  $f : \mathbf{X}(D) \rightarrow \mathbb{R}$  be a continuous function. Then the **vector surface integral** (or **Flux**) of  $\mathbf{F}$  along  $\mathbf{X}$  is

$$\int \int_{\mathbf{X}} \mathbf{F} \cdot d\mathbf{S} = \int \int_D \mathbf{F}(\mathbf{X}(s, t)) \cdot \mathbf{N}(s, t) ds dt$$

where  $\mathbf{N}(s, t) = T_s \times T_t$ .

**Example** Find the flux of  $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$  across the surface  $S$  consisting of the triangular region of the plane  $2x - 2y + z = 2$  that is cut out by the coordinate planes. Use an upward-pointing normal to orient  $S$ .

# Orientation

## Definition

An **orientable** surface has two sides that can be painted red and blue resp.

## Definition

If a parameterized surface  $S$  is orientable, then an **orientation** is a choice of one of two normal vectors.

$$N_1 = T_s \times T_t$$

or

$$N_2 = T_t \times T_s = -N_1$$
