

Math 240: Diagonalization

Ryan Blair

University of Pennsylvania

Friday March 2, 2012

Outline

- 1 Notes on Eigenvalues
- 2 Diagonalizability

Today's Goals

- 1 Be able to diagonalize matrices.
- 2 Be able to use diagonalization to compute high powers of matrices.

Important Examples

- 1 A matrix may have no eigenvalues (We don't count non-real eigenvalues)
- 2 A matrix may have multiple eigenvectors for a single eigenvalue.
- 3 A $n \times n$ matrix may not have n linearly independent eigenvectors.

Diagonalizability

Definition

An $n \times n$ matrix A is **diagonalizable** if there exists an $n \times n$ invertible matrix P and an $n \times n$ diagonal matrix D such that $P^{-1}AP = D$.

When A is diagonalizable, the columns of P are the eigenvectors of A and the diagonal entries of D are the corresponding eigenvalues.

Diagonalizability

Definition

An $n \times n$ matrix A is **diagonalizable** if there exists an $n \times n$ invertible matrix P and an $n \times n$ diagonal matrix D such that $P^{-1}AP = D$.

When A is diagonalizable, the columns of P are the eigenvectors of A and the diagonal entries of D are the corresponding eigenvalues.

Example: Find an invertible matrix P and a diagonal matrix D so that $P^{-1}AP = D$.

$$A = \begin{pmatrix} 1 & 0 & 1 \\ 0 & -1 & 3 \\ 0 & 0 & 2 \end{pmatrix}$$

Diagonalizability Theorems

Theorem

A $n \times n$ matrix is diagonalizable if and only if it has n linearly independent eigenvectors.

Theorem

If an $n \times n$ matrix has n distinct eigenvalues, then it is diagonalizable.

Diagonalizability Theorems

Theorem

A $n \times n$ matrix is diagonalizable if and only if it has n linearly independent eigenvectors.

Theorem

If an $n \times n$ matrix has n distinct eigenvalues, then it is diagonalizable.

Note: Not all diagonalizable matrices have n distinct eigenvalues.

Using Diagonalization to Find Powers

If a matrix is diagonalizable, there is a very fast way to compute its powers.

Using Diagonalization to Find Powers

If a matrix is diagonalizable, there is a very fast way to compute its powers.

If A is diagonalizable, then

$$A^n = (PDP^{-1})^n = PD^nP^{-1}$$

Using Diagonalization to Find Powers

If a matrix is diagonalizable, there is a very fast way to compute its powers.

If A is diagonalizable, then

$$A^n = (PDP^{-1})^n = PD^nP^{-1}$$

Example: Given

$$A = \begin{pmatrix} 1 & 0 & 1 \\ 0 & -1 & 3 \\ 0 & 0 & 2 \end{pmatrix}$$

compute A^8 .
